**DTF Film for UV Inks**

## UV-DTF for Over-sized and Odd-shaped Objects

### Quick Tips

Use UV-DTF on oversized or odd shaped objects, drinkware with handles, difficult to stick to substrates and surfaces that are overly reflective.

Lamination of Part A to Part B is required but does not need an expensive laminator to accomplish this task.

Use your current laminator or find one on Amazon for less than \$200.00. Search for a unit that is minimum 13" wide, heats to temp of 130 C/266 F

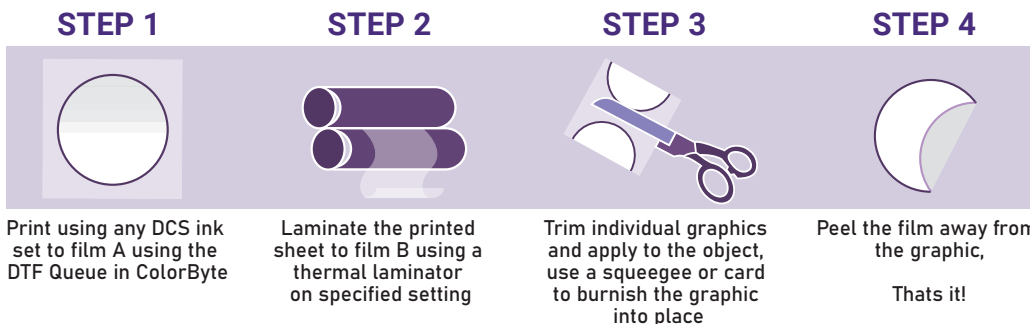

Direct-to-film (DTF) printing is an innovative print technology that has gained significant traction in a wide range of industries, including apparel, textile and promotional merchandise. DTF enables the direct transfer of a design from file to film, which is then transferred onto the target substrate using pressure and/or heat. UV-DTF has increased durability, ensuring long-lasting prints that resist fading and wear. DTF can achieve high-resolution prints with sharp details and vibrant color. This print technology represents a significant advancement in digital printing, offering versatility, cost-effectiveness and high-quality results.

UV-DTF films are developed specifically for use with UV curable inks on hard substrates such as wood, metal, glass and acrylic. Through use of these surfaces, the application range can be expanded beyond textiles to include signage, promotional items, parts and decorative products. The focus of many DTF technologies is aimed at garment or T-Shirt applications but there is a significant area for the use of DTF on hard surfaces in the production of promotional items, decoration and customization. While garment/T-shirt applications are not the goal of DCS InkMark UV-DTF, there are some soft surfaces applications that can be explored such as bags and totes, workwear and heavy linen objects. UV-DTF has increased durability, ensuring long-lasting prints that resist fading and wear. DTF can achieve high-resolution prints with sharp details and vibrant color.

InkMark UV materials offer a solution for your existing UV printer and inks. UV-DTF is a 2-part film system can be used with all current DCS inks across the Direct Jet product line. This eliminates the need to buy additional equipment to decorate difficult objects and substrates.

### Easy Application

Compatible with all current DCS ink sets and available from Direct Color System's InkMark Materials. The application of UV-DTF is easy and the results are durable. The only additional item you need is a low cost thermal laminator.
